## Programming and Elementary Data Structures

Linux

Change Directory

- Basic command: cd pathname
  - E.g., cd /usr/bin
    typical path name format

- Special characters for directories
  - root directory: /
  - home directory: ~
    - Linux is a multi-user operating system. It is the "home directory" of you.
  - current directory: .
  - parent directory: ..

Aside: Root Directory

- Directory in Linux is organized as a tree
- The topmost directory is root directory "/"

```
                    /
        ┌───────────┼───────────────┐
      bin/        home/          lib/  · · ·
                    │        ┌─────┼─────┐
              ┌─────┼─────┐
            mary/ peter/ ...
```

List Contents of a Directory

- Basic command: ls <u>directory</u>
  - E.g., ls /home

- ls (i.e., "ls" alone): list the current working directory

Options

- ls -l [directory]: list in long format
- ls -a [directory]: list all files including the hidden files
  - Hidden files: file name begin with a dot. E.g., ".bash_history"
- In Linux, options can be combined together.
  - "ls -la" or "ls -l -a"

4

Aside: Long Format of File Information

- ls -l

```
-rw-------   1 john john 576      Apr 17 1998     weather.txt
drwxr-xr-x   6 john john 1024     Oct 9 1999      web_page
-rw-rw-r--   1 john john 276480   Feb 11 20:41    web_site.tar
-rwx------   1 john john 5743     Dec 16 1998     my_app
```

permission   owner   file size   file name

(in bytes)

- File permission
  - First character: '-' regular file; 'd' directory
  - Next three: read, write, execution permission of the owner
  - Next three: read, write, execution permission of the group
  - Final three: read, write, execution permission of everyone else

Manipulating Files/Directories

- Create directories: mkdir <u>dir</u>

- Delete directories: rmdir <u>dir</u>
  - Can only remove **empty** directory

- Create an empty file: touch <u>file</u>

Copy Files/Directories

- Basic command: cp <u>source</u> <u>dest</u>

- Variations
  - cp file1 file2: copy the content of file1 into file2
  - cp file1 dir: copy file into a directory
    - cp file1 file2 dir
    - cp file* dir

Question: How do you list all the ".cpp" file in the current directory?

      - *: wildcard, matches any character
  - cp -r dir1 dir2: If dir2 does not exist, copy dir1 as dir2. If dir2 exists, copy dir1 **<u>inside</u>** dir2

Rename/Move a File

- Basic command: mv <u>source</u> <u>dest</u>

- Variations

  - mv file1 file2: rename file1 as file2

  - mv file1 dir: move file into a directory

  - mv dir1 dir2: If dir2 does not exist, then rename dir1 as dir2. If dir2 exists, then move dir1 **<u>inside</u>** dir2

Delete Files/Directories

- Basic command: rm <u>file</u>

- Variations
  - rm file: delete file
  - rm file1 file2: delete file1 and file2
  - rm -r dir: delete dir along with its contents

- Useful options -i: prompt before every removal
  - To use: alias rm='rm -i';
  - Put it into ~/.bashrc

Edit/Show a File

- Edit file: nano _file_   gedit _file_
  - advanced editor: vim, emacs
- Show file content
  - cat _file_
  - less _file_
    - quit 'less': press 'q'
    - go to the end: press 'G' (shift + g)
    - go to the beginning: press 'g'
    - search: press '/', then enter the thing to be searched
    - press 'n' for the next match; press 'N' for the previous match.

I/O Redirection

- Most command line programs display their results on the **standard output**.

  - By default, standard output is our display.

- We can redirect from standard output to a file by using '>'.

  - E.g., ls -l > ls_rst.txt: the "ls" result is now in ls_rst.txt

I/O Redirection

- Many commands can accept input from a facility called **standard input**.
  - By default, standard input is our keyboard.
- We can redirect standard input from a file instead of keyboard by using '<'.
  - One application: testing
  - E.g., my_add < input.txt
    # my_add is a program taking two inputs from keyboard and output their sum on screen
- Question: what does the following command mean?
  - my_add < input.txt > output.txt

Other Commands

- Auto completion: type a few characters; then press 'Tab'
  - If there is a single match, Linux completes the remaining.
  - If there are multiple matches, hit the second time, Linux show the candidates.
- Compare two files: diff file1 file2
  - If files are the same, no output
  - If there are differences: lines after "<" are from the first file; lines after ">" are from the second file
  - In a summary line: 'c': change; 'a': add; 'd': delete
  - Useful option "-w": ignore white spaces (space, tab)

Other Commands

- Install a program: sudo apt-get install <u>program</u>
  - E.g., sudo apt-get install emacs
  - sudo <u>command</u>: execute <u>command</u> as a superuser
    - Need you to type your password
- Remove a program: sudo apt-get autoremove <u>program</u>
- Looking for help? man <u>command</u> E.g., man ls
  - Browse the manual using the same command as for 'less'
